Monomers of S protein, prior to glycosylation, are 128 – 160 kDa, but molecular masses of the glycosylated forms of full length monomers fall in the range of 150 – 200 kDa. The S molecule is thus highly glycosylated, and this modification is exclusively N linked (Holmes 1981, Rottier 1981). S protein ectodomains have from 19 to 39 potential consensus glycosylation sites, but a comprehensive mapping of actual glycosylation has not yet been reported for any coronavirus.
