Abstract. Strainsoftening (unstable) flexural behavior (Fig.1a) has been observed in triangulated steel frames, reinforced concrete and composite beams and joints in precast concrete constructions; its strong implications in the overall structural response have been emphasized, and a systematic study often advocated but so far only begun (cf. [1-7]).

1. Introduction. Time delays often occur in many practical systems such as chemical or industrial process control and networked control systems, which can result in deterioration of system performance or even instability (Gu et al., 2003, Kao and Lincoln, 2004, Krstic, 2010, Mazenc et al., 2017, Richard, 2003). In the past few decades, the problem of
